## Chemistry          CHEM5

### Unit 5    Energetics, Redox and Inorganic Chemistry

Tuesday 17 June 2014      1.30 pm to 3.15 pm

**For this paper you must have:**
- the Periodic Table/Data Sheet provided as an insert (enclosed)
- a ruler with millimetre measurements
- a calculator.

## Time allowed
- 1 hour 45 minutes

## Instructions
- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page.
- Answer **all** questions.
- You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
- All working must be shown.
- Do all rough work in this book. Cross through any work you do not want to be marked.

## Information
- The marks for questions are shown in brackets.
- The maximum mark for this paper is 100.
- You are expected to use a calculator, where appropriate.
- The Periodic Table/Data Sheet is provided as an insert.
- Your answers to the questions in **Section B** should be written in continuous prose, where appropriate.
- You will be marked on your ability to:
  – use good English
  – organise information clearly
  – use scientific terminology accurately.

## Advice
- You are advised to spend about 75 minutes on **Section A** and about 30 minutes on **Section B**.

## CHEM5

## Section A

Answer **all** questions in the spaces provided.

**1 (a)** Write an equation for the process that has an enthalpy change equal to the electron affinity of chlorine.

**[1 mark]**

.......................................................................................................................................

**1 (b)** In terms of electrostatic forces, suggest why the electron affinity of fluorine has a negative value.

**[2 marks]**

.......................................................................................................................................

.......................................................................................................................................

.......................................................................................................................................

.......................................................................................................................................

**1 (c) (i)** Complete the Born–Haber cycle for silver fluoride by adding the missing species on the dotted lines.

**[3 marks]**

$Ag^+(g)$ + ......................

$Ag^+(g)$ + ......................

$Ag^+(g) + F^-(g)$

$Ag(g)$ + ......................

$Ag(s)$ + ......................

$AgF(s)$
**1 (c) (ii)** Use the cycle in Question **1 (c) (i)** and the data in **Table 1** to calculate a value, in kJ mol$^{-1}$, for the bond enthalpy of the fluorine–fluorine bond.

**[2 marks]**

**Table 1**

| Enthalpy change | Value / kJ mol$^{-1}$ |
|---|---|
| Enthalpy of atomisation for silver | +289 |
| First ionisation energy for silver | +732 |
| Electron affinity for fluorine | –348 |
| Experimental enthalpy of lattice dissociation for silver fluoride | +955 |
| Enthalpy of formation for silver fluoride | –203 |

.......................................................................................................................................

.......................................................................................................................................

.......................................................................................................................................

.......................................................................................................................................

**Question 1 continues on the next page**

**Turn over ▶**

**1 (d)** A theoretical value for enthalpy of lattice dissociation can be calculated using a perfect ionic model.

The theoretical enthalpy of lattice dissociation for silver fluoride is +870 kJ mol$^{-1}$.

**1 (d) (i)** Explain why the theoretical enthalpy of lattice dissociation for silver fluoride is different from the experimental value that can be calculated using a Born–Haber cycle.

**[2 marks]**

ANSWER IN THE SPACES PROVIDED

**2**    **Table 2** shows some enthalpy change and entropy change data.

**Table 2**

|  | $\Delta H$/ kJ mol$^{-1}$ | $\Delta S$ / J K$^{-1}$ mol$^{-1}$ |
|---|---|---|
| $AgCl(s) \longrightarrow Ag^+(g) + Cl^-(g)$ | +905 | |
| $AgCl(s) \longrightarrow Ag^+(aq) + Cl^-(aq)$ | +77 | +33 |
| $AgF(s) \longrightarrow Ag^+(aq) + F^-(aq)$ | −15 | to be calculated |
| $Ag^+(g) \longrightarrow Ag^+(aq)$ | −464 | |

**2 (a)**    Define the term **enthalpy of hydration** of an ion.

[2 marks]

..............................................................................................................................

..............................................................................................................................

..............................................................................................................................

..............................................................................................................................

**2 (b)**    Use data from **Table 2** to calculate a value for the enthalpy of hydration of the chloride ion.

[2 marks]

..............................................................................................................................

..............................................................................................................................

..............................................................................................................................

..............................................................................................................................

..............................................................................................................................

**2 (c)**    Suggest why hydration of the chloride ion is an exothermic process.

[2 marks]

..............................................................................................................................

..............................................................................................................................

..............................................................................................................................

..............................................................................................................................

..............................................................................................................................

**2 (d)** Silver chloride is insoluble in water at room temperature.

Use data from **Table 2** to calculate the temperature at which the dissolving of silver chloride in water becomes feasible.
Comment on the significance of this temperature value.

**[4 marks]**

Calculation of temperature ........................................................................................

**5**     **Table 3** shows some standard electrode potential data.

**Table 3**

|  | $E^\ominus$/V |
|---|---|
| $ZnO(s) + H_2O(l) + 2e^- \longrightarrow Zn(s) + 2OH^-(aq)$ | −1.25 |
| $Fe^{2+}(aq) + 2e^- \longrightarrow Fe(s)$ | −0.44 |
| $O_2(g) + 2H_2O(l) + 4e^- \longrightarrow 4OH^-(aq)$ | +0.40 |
| $2HOCl(aq) + 2H^+(aq) + 2e^- \longrightarrow Cl_2(g) + 2H_2O(l)$ | +1.64 |

**5 (a)**     Give the conventional representation of the cell that is used to measure the standard electrode potential of iron as shown in **Table 3**.

**[2 marks]**

.................................................................................................................................

**5 (b)**     With reference to electrons, give the meaning of the term **reducing agent**.

**[1 mark]**

.................................................................................................................................

.................................................................................................................................

**5 (c)**     Identify the weakest reducing agent from the species in **Table 3**.

Explain how you deduced your answer.

**[2 marks]**

Species.........................................................................................................................

Explanation...................................................................................................................

.................................................................................................................................

**5 (d)**   When HOCl acts as an oxidising agent, one of the atoms in the molecule is reduced.

**5 (d) (i)**   Place a tick (✓) next to the atom that is reduced.

**[1 mark]**

| Atom that is reduced | Tick (✓) |
|:---:|:---:|
| H | |
| O | |
| Cl | |

**5 (d) (ii)**   Explain your answer to Question **5 (d) (i)** in terms of the change in the oxidation state of this atom.

**[1 mark]**

...................................................................................................................................

...................................................................................................................................

**5 (e)**   Using the information given in **Table 3**, deduce an equation for the redox reaction that would occur when hydroxide ions are added to HOCl

**[2 marks]**

**Turn over ▶**

**Section B**

Answer **all** questions in the spaces provided.

**7** The characteristic properties of transition metals include coloured ions, complex formation and catalytic activity.

**7 (a)** Consider the chromium complexes **P** and **Q**.

$$[Cr(H_2O)_6]^{3+}(aq) \longrightarrow [Cr(H_2O)_5Cl]^{2+}(aq)$$
red-violet                              green
**P**                                     **Q**

Explain, with reference to oxidation states and electron configurations, why the chromium ions in complexes **P** and **Q** contain the same number of d electrons. You should **not** consider the electrons donated by the ligands.

Explain, in terms of electrons, why the complexes are **different** colours.
(You are **not** required to explain why the observed colours are red-violet and green.)
